

Homework 4, due September 26th, 11:59pm

September 19, 2019

1. Implement the TISP variable selection method for classification (as described in pages 12 of the Regularized Loss course notes), with the hard-thresholding penalty, described in page 11 (with $\eta = 0$). Take special care to **normalize each column** of the X matrix to have zero mean and variance 1 and to use the same mean and standard deviation that you used for normalizing the train set also for normalizing the test set.

- a) Using the `Gisette` data, train a TISP classifier on the training set, starting with $\mathbf{w}^{(0)} = \mathbf{0}$, with 100 iterations. Find appropriate λ -s to select approximately 10, 30, 100, 300, 500 features. Plot the misclassification error vs the number of selected features. Report in a table these misclassification errors on the training and test set, the corresponding numbers of selected features and the values of λ . (4 points)
- b) Repeat point a) on the `dexter` dataset. (2 points)
- c) Repeat point a) on the `madelon` dataset. (2 points)
